### Keywords:

*Piperaceae*,  
*Piper*,  
essential oil,  
composition,  
bioactivity.

**Abstract:** The genus *Piper*, a prominent member of the Piperaceae family, encompasses over 2,000 species and is widely distributed, particularly in Southeast Asia. Known for its medicinal and economic significance, several *Piper* species have been traditionally utilized in their native regions for various purposes. These species thrive in tropical areas, primarily as aromatic shrubs and trees that produce essential oils in significant quantities. Widely valued for their therapeutic properties, these oils are extensively used in the food, pharmaceutical, and cosmetic industries. Recent studies on Malaysian *Piper* species have highlighted notable pharmacological activities associated with their essential oils. This review provides an in-depth overview of the medicinal applications, chemical composition, and bioactivities of essential oils from key *Piper* species. Data were gathered through comprehensive searches of electronic databases, including Scopus, PubMed, ScienceDirect, SciFinder, and Google Scholar, along with a library search for peer-reviewed articles. The review focuses on the chemical constituents of *Piper* essential oils, offering insights into selecting species with optimal chemical profiles for diverse applications.

## 1. INTRODUCTION

The Piperaceae family, often referred to as the pepper family, represents a highly diverse group of flowering plants comprising five primary genera: *Piper*, *Peperomia*, *Zippelia*, *Manekia*, and *Verhuellia*. Among these, *Piper* and *Peperomia* are the most prominent, known for their widespread distribution and multifaceted uses. This family is characterized by its ecological adaptability, predominantly thriving in tropical and subtropical regions, particularly in Central and South America. They range in form from small trees and shrubs to herbaceous plants. One of the defining features of Piperaceae plants is their strong aromatic scent, which is derived from essential oils stored within their tissues. These essential oils not only contribute to the characteristic fragrances of these plants but also play crucial roles in their interactions with herbivores and pollinators (Salehi et al., 2019). Most Piperaceae plants exhibit simple leaves that are typically heart-shaped or oval, serving both as identifiers and as sources of bioactive compounds that have significant medicinal properties. The flowers are generally small and arranged in spikes or clusters, lack a perianth, which is an adaptation that aids in attracting specific pollinators such as flies and beetles. This floral structure reflects the evolutionary strategies to maximize pollination efficiency while minimizing energy expenditure on elaborate floral displays (Valentin-Silva, 2023).

Structurally, the Piperaceae family displays several unique adaptations that enhance its ecological success. Many species grow from underground stems known as rhizomes, allowing them to thrive in diverse environments. By spreading laterally through rhizomes, these plants can efficiently colonize new areas while maintaining genetic continuity. The fruits produced by Piperaceae plants are typically small and stone-like, containing a single seed, this trait aids in efficient reproduction by ensuring successful dispersal mechanisms. The small size

and hard texture of the fruits allow them to be easily dispersed by animals or water, increasing the likelihood of germination in suitable habitats. Some species exhibit adaptations such as fleshy fruit coverings that attract frugivorous animals, further enhancing seed dispersal (Smith et al., 2008).

The Piperaceae family is essential to multiple economic sectors, including agriculture, food, medicine, and cosmetics. Its most notable economic contribution lies in the spice industry. Members of the Piperaceae family, such as black pepper, are essential culinary ingredients used globally to enhance the flavor of foods. They are among the most traded spices in the world, with substantial demand in international markets. The global popularity of these spices has made them important agricultural commodities, supporting economies in major producing regions (Salehi et al., 2019). In addition to their culinary use, plants from the Piperaceae family are also valued for their medicinal properties, contributing to the pharmaceutical and nutraceutical industries. Many species in this family have been used in traditional medicine for their anti-inflammatory, antimicrobial, and antioxidant properties. The bioactive compounds found in these plants, including alkaloids, flavonoids, and essential oils, are the focus of ongoing research aimed at identifying novel therapeutic compounds. This growing body of research highlights the potential for these plants to provide new solutions for treating a range of health conditions, making them economically significant in modern drug development (Biswas et al., 2022).

The Piperaceae family also plays a role in the cosmetics and personal care industries. Essential oils derived from specific species are valued for their fragrance and therapeutic benefits. Due to their antibacterial and anti-inflammatory properties, these oils are widely incorporated into skincare products, perfumes, and toiletries. With increasing consumer demand for natural, plant-based products, the role of Piperaceae plants in the

cosmetics industry is expected to continue growing, further increasing their economic value (Michalak, 2022).

Furthermore, Piperaceae plants have cultural and social importance, especially in many regions of Southeast Asia. Some plants from this family are used in traditional practices, rituals, and social gatherings, which provides economic opportunities for local communities engaged in the cultivation and trade of these plants. The cultural significance of these plants further underscores their economic importance, as they support livelihoods and sustain cultural traditions (Salehi et al., 2019). In addition to their economic uses, Piperaceae plants play important roles in maintaining biodiversity and ecosystem services. Many species in this family contribute to the health of tropical ecosystems by providing food and habitat for various animal and insect species. The conservation of these plants is crucial for preserving biodiversity and supporting industries that rely on healthy ecosystems. Therefore, the economic significance of the Piperaceae family extends beyond immediate financial benefits to include broader ecological contributions that sustain industries and communities (Thorn et al., 2020).

In recent years, interest in essential oils and plant-derived aromatic compounds used in alternative medicine has significantly increased. As a result, a review focusing on *Piper* essential oils is essential to consolidate and simplify existing knowledge. This review is based on data collected through electronic searches across databases such as Scopus, PubMed, ScienceDirect, SciFinder, and Google Scholar. Its aim is to provide a comprehensive summary of the published studies on the chemical composition, biological activities, and medicinal applications of *Piper* essential oils.

## 2. MORPHOLOGICAL CHARACTERISTICS AND TRADITIONAL MEDICINAL USES OF THE *Piper* GENUS

The Piperaceae family exhibits a remarkable diversity of medicinal applications, with various *Piper* species traditionally used across different cultures. The data in **Table 1** highlights the extensive ethnomedicinal significance of these plants, emphasizing their role in treating a broad spectrum of ailments. Among the plant parts utilized, leaves are the most frequently employed, often for their anti-inflammatory (*P. marginatum*, *P. ovatum*, *P. aduncum*), respiratory (*P. sarmentosum*, *P. kadsura*, *P. guineense*), analgesic (*P. amalago*, *P. regnellii*, *P. ovatum*), and antimicrobial (*P. angustifolium*, *P. caninum*, *P. elongatum*) properties. This suggests that bioactive compounds responsible for these therapeutic effects are likely concentrated in the foliage, making them a sustainable resource compared to roots or stems (Salehi et al., 2019; Sheti et al., 2019).

The fruits of several *Piper* species, including *P. longum*, *P. nigrum*, *P. chaba*, and *P. umbellatum*, are predominantly used for respiratory disorders, digestive issues, and even as antidotes for venomous bites. Their widespread use in traditional medicine aligns with modern pharmacological findings, particularly in digestive health and metabolic regulation. Roots and stems, though less frequently cited, play essential medicinal roles, such as antidotes for snake venom (*P. sylvaticum*, *P. tuberculatum*), pain relief (*P. mikanianum*), and respiratory treatments (*P. sarmentosum*), indicating the presence of potent bioactive compounds with specific pharmacological actions (Mbadiko et al., 2023). The medicinal properties of *Piper* species encompass a wide range of biological activities, including anti-inflammatory, antimicrobial, analgesic, and antimalarial effects. Notably, *P. aduncum* and *P. angustifolium* are recognized for their wound-healing and antiseptic properties, supporting their potential for developing topical treatments. Meanwhile, species such as *P. methysticum* and *P. capense* demonstrate efficacy in treating respiratory conditions, which aligns with their traditional use in managing asthma and bronchitis. Interestingly, several *Piper* species (*P. piscatorum*, *P. macedoi*, *P. divaricatum*) exhibit insecticidal or pesticidal properties, highlighting their potential for biopesticide development as natural alternatives to synthetic chemical pesticides (Lima et al., 2020).

Additionally, certain species, such as *P. umbellatum* and *P. wallichii*, have been traditionally used for treating conditions

like dysmenorrhea, filariasis, and even as stimulants, suggesting the presence of bioactive alkaloids or flavonoids that may warrant further phytochemical investigation. The extensive applications of *Piper* species in traditional medicine reinforce their significance not only in ethnopharmacology but also in modern drug discovery. Further phytochemical and pharmacological studies are essential to validate these traditional claims, potentially leading to the discovery of novel therapeutic agents that can contribute to modern medicine and healthcare solutions (Kamsu et al., 2024).

**Table 1:** Traditional uses of several *Piper* species

Species	Part	Traditional uses
<i>P. aequale</i>	Leaves	It effectively treats urinary and prostate ailments (Sánchez-Aguirre et al., 2024)
<i>P. amalago</i>	Leaves	It helps treat chest pain and gastrointestinal issues and effective in alleviating inflammation (Martha et al., 2013)
<i>P. aduncum</i>	Leaves	It is used to treat inflammation and effectiveness against general urinary, throat, and venereal diseases (Orjala et al., 1994)
<i>P. angustifolium</i>	Leaves	It acts as a disinfectant for wounds and sores. (Tirillini et al., 1996)
<i>P. auritum</i>	Leaves	It is used to treat asthma, counteract scorpion stings, reduce fever, alleviate rheumatism and sores, manage gout, act as a diuretic, and address chronic laryngitis (Domínguez & Alcorn, 1985)
<i>P. betle</i>	Leaves	It is used as a mouthwash for swollen gums, bleeding, or bad breath (Depi et al., 2020)
<i>P. caninum</i>	Leaves	It is used to treat throat ache and acts as an antiseptic (Salleh et al., 2011)
<i>P. chaba</i>	Fruits	It is used to treat a variety of conditions, including asthma, fever, bronchitis, and abdominal pain (Prasad et al., 2005)
<i>P. capense</i>	Fruits	It helps with diarrhea and cough (Rojas et al., 2006)
<i>P. divaricatum</i>	Leaves	It is used as an insecticidal against fire ant (Souto et al., 2012)
<i>P. elongatum</i>	Leaves	It is used to treat the symptoms of cutaneous leishmaniasis (Terreaux et al., 1998)
<i>P. guineense</i>	Leaves	It acts as a flavoring agent and is used to treat bronchitis, gastrointestinal diseases, and rheumatism (Colvard et al., 2006)
<i>P. hispidum</i>	Leaves	It acts as a poultice to heal wounds and symptoms of cutaneous leishmaniasis (Terreaux et al., 1998)
<i>P. jaborandi</i>	Leaves	Commonly used as a local anesthetic (Urbina & Docampo, 2003)
<i>P. kadsura</i>	Leaves	Treating arthritic conditions and asthma (Martha et al., 2013)
<i>P. longum</i>	Fruits	It is used for treating bronchitis, coughs, colds, snakebites, and scorpion stings (Biswas et al., 2024).
	Roots	It provides a cooling effect and is used as a stomachic, antidiarrhoeic, and laxative (Biswas et al., 2024)
<i>P. lanatum</i>	Aerial	It is used to treat fever, toothache, influenza, rheumatism, ulcer, malaria and acts as a deworming (Salleh et al., 2014a)
<i>P. lanceaeifolium</i>	Fruits	It helps in treating skin infections (Martha et al., 2013)
<i>P. macedoi</i>	Leaves	It is used as an insecticide (Lima et al., 2024)
<i>P. marginatum</i>	Leaves	It is used to treat inflammation, snake bites, liver and bile duct diseases, and toothaches (Ma et al., 2004)
<i>P. mikanianum</i>	Roots	It effectively treats stomach disorders (Soares et al., 2022)
<i>P. methysticum</i>	Fruits	It is used to treat bronchitis, asthma, and fever (Prasad et al., 2005)
<i>P. nigrum</i>	Fruits	It is used to enhance glucose uptake and to treat abdominal tumors (Chaveerach et al., 2006).
	Leaves	It relieves pain, atrophic arthritis, influenza, fever, and aids digestion, and treatment for coughs (Bagheri et al., 2014)
<i>P. ovatum</i>	Leaves	Treating inflammation and acts as an analgesic (Silva et al., 2009)
<i>P. piscatorum</i>	Leaves	It is a remedy for toothache and a substitute for tobacco chewing (Holetz et al., 2002)
	Roots	It is used as a poison for fish, a remedy for toothache, and a substitute for chewing tobacco (Holetz et al., 2002)
<i>P. regnellii</i>	Leaves	It helps in treating wounds and reducing swelling and skin irritation (Silva et al., 2009)
<i>P. ribesoides</i>	Stem	It acts as a carminative, tonic element, and antilutulent (Martha et al., 2013)
<i>P. sarmentosum</i>	Leaves	It treats conditions like fever, cough, rheumatism, diarrhea, toothache, and traumatic injuries (Sun et al., 2020)
	Roots	It is used to treat toothache, headache, asthma, cough, pleurisy, and fungal dermatitis (Chan et al., 2014)
<i>P. sylvaticum</i>	Roots	It is used as an antidote to snake venom (Chahal et al., 2011)
<i>P. tuberculatum</i>	Leaves	It acts as a sedative and is used as an antidote for snake bites (Holetz et al., 2002)
<i>P. tricuspe</i>	Fruits	It is used to treat snake bites and acts as an antimalarial (Pino et al., 2005)
<i>P. umbellatum</i>	Fruits	It is used to treat poisoning, fetal malpresentation, pitting edema, rheumatism, filariasis, hemorrhoids, and dysmenorrhea (Ampofo et al., 1987)
<i>P. wallichii</i>	Stems	It helps in treating influenza, asthma, and flatulence, and acts as a stimulant (Chaveerach et al., 2006)

## 3. ESSENTIAL OILS COMPOSITION

Essential oils have been used for over 3,000 years, dating back to ancient civilizations like Egypt, China, and India, primarily for medicinal and religious purposes. Their applications evolved through the Renaissance in Europe, leading to the development of aromatherapy by René-Maurice Gattefossé in the early 20th century (Elshafie et al., 2017). In Malaysia, essential oils are deeply rooted in traditional practices, such as "jamu," where oils from native plants like *Pandanus* and *Cinnamomum* are used for therapeutic purposes. These oils, valued for their antimicrobial, anti-inflammatory, and antioxidant properties, have diverse applications in cosmetics, healthcare, food preservation, and aromatherapy (Salleh et al., 2012a). The chemical complexity of essential oils, rich in terpenes and functional groups like alcohols and ketones, underpins their biological effects. Extraction methods, including steam distillation and cold pressing, preserve their therapeutic properties, while analytical techniques like GC-MS ensure precise chemical profiling. The versatility of essential oils across industries reflects their growing demand for natural, eco-friendly solutions (de Sousa et al., 2023).

**Table 2** provides an overview of the major components identified in *Piper* species, illustrating their significance in defining the chemical and biological properties of these plants. This data highlights the global diversity and distribution of *Piper* essential oils while also identifying common patterns in their chemical composition. The most common country is Brazil indicating its prominence in the production and study of *Piper* essential oils (da Silva et al., 2016; Carvalho et al., 2022; Genderen et al., 1999). The country's rich biodiversity and favorable climate for *Piper* species cultivation contribute to this status. Other significant contributors include Colombia (Caballero-Gallardo et al., 2014; Colorado et al., 2019), Peru (Ruiz-Vásquez et al., 2022; Genderen et al., 1999), Vietnam (Hieu et al., 2014; Vu et al., 2021), and Ecuador (Guerrini et al., 2009; Gilardoni et al., 2020), emphasizing the tropical and subtropical regions as hotspots for essential oil production. Certain chemical components repeatedly appear as dominant constituents across various *Piper* species and locations.

Essential oils from *Piper* species commonly contain sesquiterpenes like  $\beta$ -caryophyllene (Carmo et al., 2012), germacrene D (Lima et al., 2024), and bicyclogermacrene (Soares et al., 2022), as well as monoterpenes such as  $\alpha$ -pinene (Carvalho et al., 2022) and  $\beta$ -pinene (Sales et al., 2018). These compounds not only contribute to their medicinal properties but also play a crucial role in their chemotaxonomic classification.

Chemo-types, or chemical variations within a species, further distinguish *Piper* species based on their dominant phytochemical constituents. The sesquiterpene-rich chemo-type, found in species such as *P. nigrum* (Al-Sayed et al., 2021), *P. betle* (Efidi et al., 2023), and *P. aduncum* (Monzote et al., 2017), is characterized by high levels of  $\beta$ -caryophyllene and germacrene D. The monoterpene-rich chemo-type, present in *P. auritum* (Caballero-Gallardo et al., 2014), *P. guineense* (Oyemitan et al., 2015), and *P. hispidum* (Colorado et al., 2019), is marked by significant amounts of  $\alpha$ -pinene,  $\beta$ -pinene, and limonene. Another important classification is the phenylpropanoid chemo-type, which includes species like *P. hispidinervum* (Mendonça et al., 2024), *P. marginatum* (Carvalho et al., 2022), and *P. sanctum* that produce safrole, eugenol, and methyl eugenol. **Figure 1** shows the chemical structures of several major components of *Piper* essential oils.

Other frequently reported components include safrole that is found in *P. auritum* (Colombia and Brazil) (Lam- Gutiérrez et al., 2024) and *P. hispidinervum* (Brazil) (Colorado et al., 2019), notable for its use in fragrance and flavor industries. Besides, limonene also identified in oils from Egypt (*P. nigrum*) (Al-Sayed et al., 2021), Vietnam (*P. boehmeriaefolium*) (Hieu et al., 2014), and Peru (*P. soledadense*) (Ruiz-Vásquez et al., 2022), often used for its refreshing citrus aroma and cleaning properties.  $\alpha$ -Pinene and  $\beta$ -pinene commonly found in essential oils from Brazil. Among the frequent utilized part for essential oil extraction, aerial parts often yield higher percentages of essential oils. For instance, *P. aduncum* (Brazil) (Monzote et al., 2017) shows a yield of 3.0% from aerial parts, primarily rich in dillapiol. *P. marginatum* (Brazil) (da Silva et al., 2016) yields 0.7% essential oil from aerial parts, with 3,4-methylenedioxypropionophenone as a significant component. In contrast, leaf oils, though widely studied, generally show lower yields, such as 0.58% in *P. hispidum* (Colombia) (Colorado et al., 2019) and 0.6% in *P. arboreum* (Brazil) (Lima et al., 2024). Fruit oils tend to have moderate yields, such as 1.01% in *P. cubeba* (Egypt) (Al-Sayed et al., 2022). This analysis highlights Brazil as a key player in *Piper* essential oil production, with leaves being the most used plant part, despite aerial parts often yielding higher percentages. The frequent occurrence of  $\beta$ -caryophyllene, safrole, and  $\alpha$ -pinene derivatives across regions underscores their significance as common constituents, demonstrating the chemical consistency and therapeutic potential of *Piper* essential oils worldwide.

**Table 2:** Major components identified from the essential oils of several *Piper* species

Species	Locality (Parts)	Total components (No., %)	Yield (%)	Major components
<i>P. auritum</i>	Colombia (Leaf)	3 (97.8)	NM	Safrole (93.2%), myristicin (4.3%) (Caballero-Gallardo et al., 2014)
	Mexico (Leaf)	27 (98.9)	0.26	Safrole (51.4%), $\gamma$ -terpinene (12.6%), $\alpha$ -terpinolene (9.6%), $\beta$ -terpinene (5.9%) (Lam- Gutiérrez et al., 2024)
<i>P. betle</i>	Indonesia (Leaf)	46 (81.7)	1.44	$\beta$ -Phellandrene (8.6%), terpinene-4-ol (7.0%), $\beta$ -caryophyllene (5.4%), $\alpha$ -humulene (6.3%), caryophyllene oxide (5.5%) (Efidi et al., 2023)
	Vietnam (Leaf)	4 (78.4)	0.25	Eugenol acetate (38.6%), methyl eugenol (30.2%), chavicol acetate (5.7%), chavicol (3.7%) (Vu et al., 2021)
<i>P. acutifolium</i>	Peru (Leaf)	14 (99.9)	0.06	$\alpha$ -Phellandrene (38.1%), $\beta$ -myrcene (29.4%), $\beta$ -phellandrene (21.8%) (Cuadros-Siguas et al., 2023)
<i>P. aduncum</i>	Cuba (Leaf)	90 (97.4)	NM	Piperitone (23.7%), camphor (17.1%), viridiflorol (14.5%) (Monzote et al., 2017)
	Brazil (Leaf)	34 (99.9)	NM	Dillapiol (81.0%), ( <i>E</i> )- $\beta$ -ocimene (3.4%), germacrene D (2.7%), bicyclogermacrene (2.3%), ( <i>Z</i> )- $\beta$ -ocimene (1.6%) (Filho et al., 2023)
	Brazil (Aerial)	47 (97.5)	3.0	Dillapiol (73.0%), germacrene D (2.7%), $\beta$ -caryophyllene (2.7%) (da Silva et al., 2016)
	Ecuador (Aerial)	45 (95.6)	0.8	Dillapiol (45.9%), ( <i>E</i> )- $\beta$ -ocimene (10.3%), piperitone (8.4%), 4-terpineol (3.1%), $\beta$ -caryophyllene (2.5%) (Guerrini et al., 2009)
	Indonesia (Leaf)	43 (85.2)	1.93	Apiole (33.4%), $\beta$ -caryophyllene (6.67%), piperitone (3.9%), $\delta$ -cadinene (3.6%), caryophyllene oxide (3.4%) (Efidi et al., 2023)
<i>P. arboreum</i>	Brazil (Leaf)	17 (72.7)	0.6	Germacrene D (34.4%), $\beta$ -caryophyllene (12.3%), valencene (7.0%), $\alpha$ -copaene (6.5%), germacrene B (6.4%), $\beta$ -pinene (6.0%) (Lima et al., 2024)
	Panama (Leaf)	42 (82.6)	NM	$\delta$ -Cadinene (25.8%), $\alpha$ -copaene (7.4%), $\beta$ -pinene (6.6%), germacrene D (5.3%), ( <i>E</i> )-nerolidol (5.2%) (Mundina et al., 1998)
<i>P. amalago</i>	Brazil (Leaf)	15 (91.1)	0.07	$\beta$ -Elemene (17%), germacrene A (15.2%), linalool (15.5%), $\beta$ -caryophyllene (11.5%) (Vasconcelos et al., 2024)
<i>P. marginatum</i>	Brazil (Leaf)	29 (95.0)	0.6	3,4-Methylenedioxypropionophenone (11.3%), germacrene D (10.8%), elemicin (9.2%), ( <i>E</i> )- $\beta$ -ocimene (7.7%), $\beta$ -caryophyllene (5.5%) (Carvalho et al., 2022)
	Brazil (Aerial)	58 (89.4)	0.7	3,4-Methylenedioxypropionophenone (21.8%), elemol (5.9%), $\beta$ -caryophyllene (5.0%), 2-methoxy-4,5-methylenedioxypropionophenone (4.8%) (da Silva et al., 2016)
<i>P. guineense</i>	Nigeria (Fruit)	44 (90.6)	NM	$\beta$ -Sesquiphellandrene (20.9%), linalool (6.1%), limonene (5.8%), $\beta$ -bisabolene (5.4%) (Oyemitan et al., 2015)
	Cameroon (Fruit)	21 (99.9)	0.2	Linalool (41.8%), 3,5-dimethoxytoluene (10.9%), $\beta$ -pinene (9.2%), $\alpha$ -terpineol (4.1%) (Tankam & Ito, 2013)
<i>P. dilatatum</i>	Brazil (Leaf)	21 (84.2)	1.5	Germacrene D (16.7%), $\alpha$ -alaskene (18.9%), viridiflorol (12.5%) (Silva et al., 2014)
	Brazil (Aerial)	58 (94.4)	1.2	$\beta$ -Elemene (13.8%), $\beta$ -pinene (10.5%), spathulenol (9.3%), bicyclogermacrene (7.9%), $\delta$ -elemene (7.6%) (Andrade et al., 2011)

Species	Locality (Parts)	Total components (No., %)	Yield (%)	Major components
<i>P. anonifolium</i>	Brazil (Aerial)	87 (89.2)	0.6	Selin-11-en-4- $\alpha$ -ol (20.0%), $\beta$ -selinene (12.7%), $\alpha$ -selinene (11.9%), $\alpha$ -pinene (8.8%) (Silva et al., 2014)
<i>P. multiplinervium</i>	Colombia (Leaf)	6 (28.3)	NM	$\beta$ -Elemene (9.0%), $\beta$ -caryophyllene (5.3%) (Caballero-Gallardo et al., 2014)
<i>P. hispidum</i>	Colombia (Leaf)	80 (87.8)	0.58	$\delta$ -3-Carene (9.6%), <i>p</i> -cymene (10.9%), limonene (17.2%), elemol (14.1%), $\gamma$ -elemene (7.3%), $\beta$ -eudesmol (5.7%) (Colorado et al., 2019)
	Cuba (Leaf)	78 (91.2)	0.17	$\alpha$ -Bisabolene (11.2%), $\beta$ -pinene (8.2%), $\alpha$ -pinene (4.7%), <i>allo</i> -aromadendrene (4.9%) (Pérez et al., 2014)
	Brazil (Aerial)	87 (88.4)	1.0	$\beta$ -Caryophyllene (10.5%), $\alpha$ -humulene (9.5%), $\delta$ -3-carene (9.1%), $\alpha$ -copaene (7.3%), limonene (6.9%) (Silva et al., 2014)
<i>P. rivinoides</i>	Brazil (Leaf)	11 (99.9)	0.14	$\alpha$ -Pinene (53.0%), $\beta$ -pinene (18.1%), limonene (12.9%), bicyclogermacrene (6.3%) (Machado et al., 2022)
<i>P. tuberculatum</i>	Brazil (Leaf)	13 (96.6)	NM	$\beta$ -Caryophyllene (26.3%), $\alpha$ -cadinol (13.7%), ( <i>E</i> )- $\beta$ -ocimene (9.0%), $\alpha$ -pinene (8.4%) (Facundo et al., 2005)
<i>P. tuberculatum</i>	Peru (Aerial)	16 (89.3)	0.13	$\beta$ -Bisabolene (40.2%), $\delta$ -cadinene (9.8%), $\beta$ -caryophyllene (9.7%), germacrene D (5.0%), ( <i>E</i> )-nerolidol (4.5%) (Ruiz-Vásquez et al., 2022)
	Brazil (Fruit)	15 (98.9)	0.34	$\beta$ -Pinene (27.7%), $\alpha$ -pinene (26.5%), $\beta$ -caryophyllene (14.3%), ( <i>E</i> )- $\beta$ -ocimene (12.4%) (Sales et al., 2018)
<i>P. cernuum</i>	Brazil (Leaf)	35 (99.8)	NM	$\alpha$ -Pinene (16.6%), $\beta$ -pinene (11.5%), bicyclogermacrene (10.7%), <i>p</i> -cymene (9.2%) (Filho et al., 2023)

On the other hand, this study provides a detailed account of the major components of essential oils extracted from *Piper* species specifically found in Malaysia. These species are known for their unique chemical profiles, which can vary depending on the geographical location and environmental conditions of the regions within Malaysia (Salleh et al., 2016). **Table 3** summarizes the major components of essential oils derived from various *Piper* species found across Malaysia. The data highlights the diversity of chemical compositions, regional variations, and plant parts used for oil extraction. Sarawak emerges as the most common state for *Piper* essential oil production in Malaysia, with numerous species. *P. arborescens* (Salleh et al., 2016), *P. porphyrophyllum* (Salleh et al., 2012b), *P. sarmentosum* (Chieng et al., 2008), and *P. officinarum* (Salleh et al., 2012a), identified in the region. This prevalence is likely due to Sarawak's tropical climate and rich biodiversity, which create ideal conditions for the growth of *Piper* species. Selangor and Perak also feature prominently, with significant contributions to the study of local *Piper* species and their chemical compositions.

$\beta$ -Caryophyllene stands out as a common component across multiple *Piper* species and regions in Malaysia. Found in essential oils from Sarawak (*P. sarmentosum*) (Chieng et al., 2008), Selangor (*P. penangense*) (Jantan et al., 1994), and Perak (*P. magnibaccum*) (Hashim et al., 2017), this compound is known for its anti-inflammatory, antimicrobial, and analgesic properties. Other frequently identified components include spathulenol found in *P. lanatum* (Sarawak) and *P. abbreviatum* (Sarawak), often noted for its anti-inflammatory and antimicrobial effects (Salleh et al., 2014a). Germacrene D present in *P. betle* (Negeri Sembilan) (Ahmad et al., 2024) and *P. magnibaccum* (Perak) (Hashim et al., 2017), valued for its aromatic and therapeutic properties. Safrrole a significant component in *P. caninum* (Perak), known for its use in fragrances and flavoring (Salleh et al., 2011). The table reveals that the leaves are the most used plant part for essential oil extraction in Malaysia, yielding moderate percentages of oil. For example, *P. sarmentosum* from Sarawak (Chieng et al., 2008) yields 1.10% essential oil from its leaves. For *P. penicellousum* (Jantan et al., 1994) from Selangor produces 1.11% from its leaves. Besides, stems and aerial parts are also utilized but generally yield lower percentages of essential oils. For instance, the stem of *P. arborescens* from Sarawak (Salleh et al., 2016) yields 0.16% essential oil. The aerial parts of *P. abbreviatum* from Sarawak yield 0.22% (Salleh et al., 2014a).

**Figure 1:** Chemical structures of several major components of *Piper* essential oils.

#### 4. PHARMACOLOGICAL STUDIES OF *Piper* ESSENTIAL OIL

The bioactivity of essential oils, particularly from various *Piper* species, underscores their remarkable versatility and potential across a range of applications, including healthcare, cosmetics, and agriculture. These oils have consistently demonstrated powerful antioxidant, antimicrobial, cytotoxic, and insecticidal properties, making them effective tools in

addressing some of the most pressing global challenges. What sets these essential oils apart is their natural origin and broad-spectrum effectiveness, positioning them as safer, more environmentally friendly, and sustainable alternatives to synthetic chemicals (Chouhan et al., 2017). Unlike synthetic counterparts, which often pose risks of toxicity and environmental harm, essential oils from *Piper* species align with the growing demand for green and sustainable solutions. Their multi-target action enhances their effectiveness across diverse applications, reducing the need for multiple chemical agents. Strong evidence, supported by detailed bioactivity metrics, highlights the significant potential of these oils for future research and innovation (Ferraz et al., 2022). They represent a promising avenue not only for therapeutic and industrial advancements but also for addressing environmental and public health concerns. As research continues to uncover their mechanisms and broader applications, *Piper* essential oils are paving the way for sustainable and effective natural solutions that align with global needs for safer, eco-conscious innovations (Salleh et al., 2016). **Table 4** shows biological activities of several *Piper* essential oils.

The table categorizes these activities into antioxidant, anti-tyrosinase, cytotoxicity, antibacterial, antifungal, insecticidal, antileishmanial, antiparasitic, anticholinesterase, and toxicological effects. The antioxidant properties of these oils are particularly notable, as evidenced by their effectiveness in DPPH, ABTS, and FRAP assays. For instance, *P. longum* demonstrates substantial radical scavenging ability with IC<sub>50</sub> values as low as 0.97  $\mu$ g/mL, suggesting its potential in oxidative stress mitigation (Biswas et al., 2024). Other species, like *P. chaba* and *P. auritum*, also exhibit significant activity, albeit with varying potency (Rahman et al., 2024).

Anti-tyrosinase activity is another critical focus, particularly for its applications in treating hyperpigmentation disorders. Species like *P. maingayi* and *P. magnibaccum* have shown promising tyrosinase inhibition percentages of 65.5% and 57.0%, respectively (Hashim et al., 2016). Similarly, their cytotoxic effects against various cancer cell lines, such as the 95.4% inhibition of MCF-7 breast adenocarcinoma cells by *P. imperiale* position these oils as promising candidates for developing anticancer therapies (Setzer et al., 2008).

The antibacterial and antifungal properties extend their utility to combating microbial infections. For instance, *P. longum* exhibits a MIC value of 1.95  $\mu$ g/mL against *Helicobacter pylori*, showcasing its potential in managing gastric ulcers (Al-Sayed et al., 2021). Similarly, *P. diospyrifolium*'s antifungal activity, with MIC values against *Candida* species as low as 8.3  $\mu$ g/mL, emphasizes its role in antifungal treatments (Bernuci et al., 2016). These findings highlight the essential oils' broad-spectrum antimicrobial activities, addressing critical needs in medicine and food safety.

*Piper* essential oils also exhibit potent insecticidal and larvicidal properties, such as *P. marginatum*'s effectiveness against *Aedes aegypti* larvae with LC<sub>50</sub> value of 19.9  $\mu$ g/mL (Torquillo et al., 1999). Such activities indicate their potential as eco-friendly alternatives to synthetic pesticides. Additionally, anti-leishmanial and anti-parasitic activities, like the IC<sub>50</sub> value of 3.4  $\mu$ g/mL exhibited by *P. hispidum* against *Leishmania amazonensis*, open avenues for treating neglected tropical diseases (Houël et al., 2016).

The diverse bioactivities of *Piper* essential oils highlight their immense potential to address various challenges across healthcare, cosmetics, and agriculture. With demonstrated antioxidant, antimicrobial, cytotoxic, anti-tyrosinase, and insecticidal properties, these oils offer promising natural solutions for pressing global issues. It has shown significant efficacy in their respective domains, supporting their use in developing new therapies, eco-friendly pesticides, and cosmetic formulations (Sharifi-Rad et al., 2017). These evidence-backed bioactivities not only reflect the therapeutic value of these oils but also their environmental and economic benefits.

**Table 4:** Biological activities of several *Piper* essential oils

Bioactivity	Essential oils	Description
Antioxidant	<i>P. longum</i>	The essential oil exhibited moderate radical scavenging activity against DPPH and ABTS, with IC <sub>50</sub> values of 0.97 and 0.78 µg/mL, respectively (Biswas et al., 2024)
	<i>P. chaba</i>	The leaf oil exhibited DPPH radical scavenging activity with IC <sub>50</sub> value of 17.03 mg/mL (Rahman et al., 2024)
	<i>P. auritum</i>	The essential oil exhibited ABTS assay with EC <sub>50</sub> value ranging from 3.02 to 4.86 g/mL (Luján -Hidalgo et al., 2017)
	<i>P. nigrum</i>	The essential oil exhibited DPPH free radical scavenging against DPPH with IC <sub>50</sub> value of 22.8 mg/mL (Abukawsar et al., 2018)
	<i>P. boehmerifolium</i>	The essential oil exhibited ABTS assay with IC <sub>50</sub> value of 7.36 µg/mL (Wang et al., 2020)
	<i>P. umbellatum</i>	The essential oil exhibited DPPH radical scavenging assay with IC <sub>50</sub> value of 32.3 µg/mL (Rodríguez et al., 2013)
	<i>P. corcovadense</i>	The essential oil exhibited FC, DPPH and ABTS with value of 5.4 mg GAE/mL, 2.8 and 6.2 µmol TE/mL respectively (Fontoura et al., 2024)
	<i>P. ecuadorensis</i>	The essential oil gave IC <sub>50</sub> value of 1.81 mg/mL in ABTS assay (Valarezo et al., 2021)
	<i>P. acutifolium</i>	The essential oil gave IC <sub>50</sub> values of 160.1, 138.1 and 450.1 µg/mL in DPPH, ABTS and FRAP assay, respectively (Cuadros-Siguas et al., 2023)
	<i>P. madeiranum</i>	The essential oil gave EC <sub>50</sub> values of 66.8 and 242.6 µg/mL in DPPH and ABTS assay, respectively (Araujo et al., 2021)
	<i>P. mollipilosum</i>	The essential oil gave EC <sub>50</sub> values of 79.0 and 280.5 µg/mL in DPPH and ABTS assay, respectively (Araujo et al., 2017)
	<i>P. glabratum</i>	The essential oil gave IC <sub>50</sub> value of 17.98 µg/mL in DPPH assay (Santos et al., 2019)
	<i>P. maingayi</i>	The essential oil gave IC <sub>50</sub> values of 14.9 and 12.6 µg/mL in DPPH and ABTS assay, respectively (Hashim et al., 2016)
	<i>P. miniatum</i>	The essential oil gave IC <sub>50</sub> value of 240.5 µg/mL in DPPH assay (Salleh et al., 2015)
	<i>P. srylosum</i>	The essential oil gave IC <sub>50</sub> value of 623.2 µg/mL in DPPH assay (Salleh et al., 2014c)
	<i>P. ribesoides</i>	The essential oil gave IC <sub>50</sub> value of 692.4 µg/mL in DPPH assay (Salleh et al., 2014c)
	<i>P. brachypetiolatum</i>	The essential gave EC <sub>50</sub> values of 64.8 and 159.7 µg/mL in DPPH and ABTS assay, respectively (Araujo et al., 2021)
	<i>P. gladiolissimum</i>	The essential oil gave EC <sub>50</sub> values of 104.4 and 200.9 µg/mL in DPPH and ABTS assay, respectively (Araujo et al., 2021)
	<i>P. magnibaccum</i>	The essential oil gave IC <sub>50</sub> values of 20.5 and 11.7 µg/mL in DPPH and ABTS assay, respectively (Hashim et al., 2017)
Anti-tyrosinase	<i>P. maingayi</i>	The essential oil demonstrated 65.5% tyrosinase inhibition activity, as assessed using the modified dopachrome method (Hashim et al., 2016)
	<i>P. magnibaccum</i>	The essential oil demonstrated 57.0% tyrosinase inhibition activity, as assessed using the modified dopachrome method (Hashim et al., 2017)
	<i>P. ribesoides</i>	The essential oil demonstrated 30.0% tyrosinase inhibition activity, as assessed using the modified dopachrome method (Salleh et al., 2014)
Cytotoxicity	<i>P. arborenses</i>	The essential oil gave LC <sub>50</sub> value of 57.9 µg/mL against <i>Artemia salina</i> (Daniel et al., 2019)
	<i>P. caninum</i>	The essential oil gave LC <sub>50</sub> value of 249.7 µg/mL against <i>Artemia salina</i> (Daniel et al., 2019)
	<i>P. aequale</i>	The essential oil gave IC <sub>50</sub> value of 8.69 µg/mL against HCT-116 human colorectal carcinoma cells (da Silva et al., 2016)
	<i>P. aleyreanum</i>	The essential oil gave IC <sub>50</sub> value of 7.40 µg/mL against SKMel19 human melanoma cells (da Silva et al., 2014)
	<i>P. longum</i>	The essential oil gave IC <sub>50</sub> value of 5.27 µg/mL against HeLa cells (Yadav et al., 2019)
	<i>P. regnellii</i>	The essential oil gave IC <sub>50</sub> values from 11.0 to 17.0 µg/mL against HeLa cells (Anderson et al., 2018)
	<i>P. klotzschianum</i>	The essential oil gave IC <sub>50</sub> value of 27.3 µg/mL against HepG2 cells (Lima et al., 2019)
	<i>P. rivinoides</i>	The essential oil gave IC <sub>50</sub> value of 59.0 µg/mL against oral squamous cell carcinoma and non-tumoral gingival fibroblasts (Machado et al., 2022)
	<i>P. trioicum</i>	The essential oil gave IC <sub>50</sub> value of 33.1 µg/mL against HT-29 cells (Jena et al., 2023)
	<i>P. lindbergii</i>	The essential oil gave CC <sub>50</sub> value of 41.3 µg/mL against toxoplasmosis (Filho et al., 2023)
	<i>P. imperiei</i>	The essential oil showed 95.4% inhibition against MCF-7 human breast adenocarcinoma cells (Setzer et al., 2008)
	<i>P. eriopodum</i>	The essential oil gave MIC value of 16.0 µg/mL inhibits the growth of <i>S. aureus</i> , <i>E. coli</i> , and <i>L. monocytogenes</i> (Acevedo et al., 2023).
	<i>P. corcovadense</i>	The essential oil gave MIC value ranging from 10.0 to 0.16 µg/mL against <i>B. subtilis</i> , <i>E. coli</i> , <i>L. monocytogenes</i> and <i>S. typhimurium</i> (Fontoura et al., 2024)
	<i>P. cubeba</i>	The essential oil gave MIC value of 7.81 µg/mL against <i>Helicobacter pylori</i> (Al-Sayed et al., 2021)
	<i>P. longum</i>	The essential oil gave MIC value of 1.95 µg/mL against <i>Helicobacter pylori</i> (Al-Sayed et al., 2021)
Antibacterial	<i>P. diospyrifolium</i>	The essential oil gave MIC value of 125 µg/mL against <i>Mycobacterium tuberculosis</i> H <sub>3</sub> Rv bacillus, with a by REMA plate method (Bernuci et al., 2016)
	<i>P. buttiloides</i>	The essential oil gave MIC value of 700.0 µg/mL against <i>E. coli</i> (Duarte et al., 2007)
	<i>P. boehmerifolium</i>	The essential oil gave MIC values ranging from 0.07-1.25 mg/mL against <i>B. subtilis</i> , <i>S. aureus</i> , <i>E. coli</i> and <i>P. aeruginosa</i> (Wang et al., 2020)
	<i>P. corcovadense</i>	The essential oil gave MIC and MBC values of 10.4 µg/mL against <i>B. subtilis</i> , <i>L. monocytogenes</i> , and <i>S. typhimurium</i> (Fontoura et al., 2024)
	<i>P. betle</i>	The essential oil gave MIC value of 64.0 µg/mL strongly controlled the growth of <i>Clostridium sporogenes</i> NCTC 12935 (Dai et al., 2023)
	<i>P. rivinoides</i>	The essential oil gave MIC value of 125 µg/mL against <i>Mycobacterium tuberculosis</i> H <sub>3</sub> Rv bacillus (Bernuci et al., 2016)
	<i>P. cernuum</i>	The essential oil gave MIC value of 125 µg/mL against <i>Mycobacterium tuberculosis</i> H <sub>3</sub> Rv bacillus (Bernuci et al., 2016)
	<i>P. mosenii</i>	The essential oil gave MIC value of 250 µg/mL against <i>Mycobacterium tuberculosis</i> H <sub>3</sub> Rv bacillus (Bernuci et al., 2016)
	<i>P. diospyrifolium</i>	The essential oil gave IC <sub>50</sub> value of 13.5 µg/mL against amastigote forms of <i>Leishmania amazonensis</i> (Bernuci et al., 2016)
	<i>P. lanceifolium</i>	The essential oil gave IC <sub>50</sub> value of 37.8 µg/mL against promastigote form of <i>Leishmania infantum</i> (Leal et al., 2013)
	<i>P. obrutum</i>	The essential oil gave IC <sub>50</sub> value of 35.9 µg/mL against promastigote form of <i>Leishmania infantum</i> (Leal et al., 2013)
	<i>P. mosenii</i>	The essential oil gave IC <sub>50</sub> value of 17.4 µg/mL against <i>Leishmania amazonensis</i> promastigotes (Bernuci et al., 2016)
	<i>P. aduncum</i>	The essential oil gave IC <sub>50</sub> value of 25.9 µg/mL against amastigote forms of <i>Leishmania amazonensis</i> (Bernuci et al., 2016)
	<i>P. hispidum</i>	The essential oil gave IC <sub>50</sub> value of 3.4 µg/mL against amastigote forms of <i>Leishmania amazonensis</i> (Houël et al., 2016)
Antifungal	<i>P. betle</i>	The essential oil gave MIC value of 64.0 µg/mL strongly controlling the growth of the fungus <i>Aspergillus niger</i> (Dai et al., 2023)
	<i>P. diospyrifolium</i>	The essential oil gave MIC values of 10.7, 9.3, and 8.3 µg/mL against <i>Candida albicans</i> , <i>C. parapsilosis</i> and <i>C. tropicalis</i> respectively (Vieira et al., 2011)
	<i>P. bogotense</i>	The essential oil gave MIC value of 79.0 µg/mL against <i>Trichophyton rubrum</i> (Castaño et al., 2014)
	<i>P. hispidum</i>	The essential oil gave MIC value of 500.0 µg/mL against <i>Fusarium oxysporum</i> (Castaño et al., 2014)
	<i>P. bredemeyeri</i>	The essential oil gave MIC value of 125.0 µg/mL against <i>Trichophyton mentagrophytes</i> (Castaño et al., 2014)
	<i>P. gaudichaudianum</i>	The essential oil gave MIC value of 32.2 µg/mL against <i>Candida krusei</i> (Giannetti et al., 2010).
	<i>P. auritum</i>	The essential oil gave MIC values of 364.7 and 254.4 µg/mL against <i>Colletotrichum acutatum</i> and <i>Botryodiplodia theobromae</i> respectively by bioautographic assay (Pineda et al., 2012)
	<i>P. solmsianum</i>	The essential oil gave MIC value of 62.5 µg/mL against <i>Cryptococcus neoformans</i> (Giannetti et al., 2010)
	<i>P. marginatum</i>	The essential oil shows moderate activity with a detection limit value ranging from 10 to 100 µg against <i>C. cladosporioides</i> and <i>C. sphareospermum</i> determined by TLC bioautography (da Silva et al., 2016)
Insecticidal	<i>P. auritum</i>	The essential oil exhibited repellent activity against <i>Tribolium castaneum</i> with RC <sub>50</sub> value of 0.002 µL/cm <sup>2</sup> (Caballero-Gallardo et al., 2014)
	<i>P. marginatum</i>	The essential oil exhibited repellent activity against <i>Solenopsis saevissima</i> with an IC <sub>50</sub> value of 240.0 µg/mL (Souto et al., 2012)
Larvicidal	<i>P. klotzschianum</i>	The essential oil gave LC <sub>50</sub> value of 122.4 µg/mL against <i>Aedes aegypti</i> larvae (Lima et al., 2019)
	<i>P. marginatum</i>	The essential oil gave LC <sub>50</sub> value of 19.9 µg/mL against <i>Aedes aegypti</i> larvae (Torquillo et al., 1999)
	<i>P. longispicum</i>	The essential oil gave LC <sub>50</sub> value of 250.0 µg/mL against <i>Aedes aegypti</i> larvae (Santana et al., 2016)
	<i>P. peruncronatum</i>	The essential oil gave LC <sub>50</sub> value of 36.0 µg/mL against <i>Aedes aegypti</i> larvae (de Moraes et al., 2007)
Anti-parasitic	<i>P. eriopodum</i>	The essential oil demonstrates a repellent effect against <i>Sitophilus zeamais</i> with an IC <sub>50</sub> value of 0.5 µg/mL (Acevedo et al., 2023).
	<i>P. lanceifolium</i>	The essential oil exhibited IC <sub>50</sub> value of 7.48 µg/mL against <i>Trypanosoma cruzi</i> (Leal et al., 2013)
	<i>P. obrutum</i>	The essential oil gave IC <sub>50</sub> value of 29.3 µg/mL against <i>Trypanosoma cruzi</i> (Leal et al., 2013)
	<i>P. septuplinervium</i>	The essential oil gave IC <sub>50</sub> value of 14.0 µg/mL against <i>Trypanosoma cruzi</i> (Leal et al., 2013)
	<i>P. mikianium</i>	The essential oil gave LC <sub>50</sub> value of 33.1 µg/mL against <i>L. braziliensis</i> (Gomez et al., 2021)
	<i>P. diospyrifolium</i>	The essential oil gave LC <sub>50</sub> value of 30.1 µg/mL against <i>L. braziliensis</i> (Gomez et al., 2021)
	<i>P. tuberculatum</i>	The essential oil gave EC <sub>50</sub> value of 133.9 and 143.5 µg/mL against <i>L. infantum</i> and <i>L. braziliensis</i> respectively (dos Santos et al., 2018)
	<i>P. lindbergii</i>	The essential oil gave EC <sub>50</sub> value of 0.83 µg/mL against <i>Toxoplasma gondii</i> (Filho et al., 2023)
Anti-proliferative		
Anti-cholinesterase	<i>P. capitarianum</i>	The essential oils showed activity on AChE with IC <sub>50</sub> value of 14.2 µg/mL (França et al. 2020)
	<i>P. ornatum</i>	The leaf oil showed significant inhibitory activity on AChE (70.2%) (Azman et al. 2022)
	<i>P. arboreum</i>	The leaf oil showed high selective inhibition for BuChE with IC <sub>50</sub> value of 29.3 µg/mL (Espinoza et al. 2023)
Toxicity	<i>P. hispidinervum</i>	The essential oil concentration ranging from 140.0 to 1000.0 µL/kg against 11 <i>Sitophilus zeamais</i> determined by concentration-mortality bioassays (Lopes et al., 2024)
	<i>P. retrofractum</i>	The essential oil gave LC <sub>50</sub> and LC <sub>25</sub> value of 0.02% and 0.19% respectively against botanical insecticide brown plant hopper (BPH) (Nuryanti et al., 2020)
	<i>P. corcovadensis</i>	The essential oil gave LD <sub>50</sub> and LD <sub>20</sub> value of 3.58 and 6.34 mg/g respectively against <i>Spodoptera frugiperda</i> (Dutra et al., 2020)
	<i>P. marginatum</i>	The essential oil gave LD <sub>50</sub> and LD <sub>20</sub> value of 4.18 and 18.1 mg/g respectively against <i>Spodoptera frugiperda</i> (Dutra et al., 2020)
	<i>P. arboreum</i>	The essential oil gave LD <sub>50</sub> and LD <sub>20</sub> value of 10.9 and 54.8 mg/g respectively against <i>Spodoptera frugiperda</i> (Dutra et al., 2020)
	<i>P. aduncum</i>	The essential oil, at a concentration of 40.0 mg/mL, caused the LT <sub>50</sub> to be 10.7 days and 16.8 days for the first and second instar respectively against <i>Helicoverpa armigera</i> (Dos Santos et al., 2017)
Anti-inflammatory	<i>P. glabratum</i>	The leaf oil significantly inhibited leukocyte migration at doses of 100, 300, and 700 mg/kg with a maximal inhibition of 92% (Branquinho et al. 2017)
	<i>P. miniatum</i>	The leaf oil gave an inhibition of 73.6% in the TPA-induced mouse ear edema assay and 76.0% in the in vitro lipoxigenase assay (Salleh et al. 2015)
	<i>P. rostratum</i>	The essential oil demonstrated moderate activity in lipoxigenase inhibition with IC <sub>50</sub> value of 77.2 µg/mL (Ramin et al., 2020)
	<i>P. gaudichaudianum</i>	The essential oil showed ability to inhibit neutrophil chemotaxis in vitro when stimulated by <i>Escherichia coli</i> lipopolysaccharide with reduction in migration of 0-72.2% (Soares et al., 2022)
	<i>P. mikianium</i>	The essential oil showed ability to inhibit neutrophil chemotaxis in vitro when stimulated by <i>Escherichia coli</i> lipopolysaccharide with reduction in migration of 8.6-100% (Soares et al., 2022)

## 5. CONCLUSION

This review provides a comprehensive analysis of the medicinal potential, chemical composition, and biological activities of essential oils extracted from *Piper* species. These oils are predominantly composed of monoterpenes and sesquiterpenes, compounds well-documented for their potent antioxidant and antimicrobial effects. The variation in chemical constituents among different *Piper* species is largely influenced by genetic diversity and environmental factors, including soil composition, climate, and geographical location. While these essential oils exhibit promising bioactive properties, their full therapeutic potential remains underexplored. Additional research is necessary to investigate their possible anti-inflammatory, anticancer, and antiviral effects, which could further expand their applications in medicine. To establish their efficacy and safety, rigorous preclinical studies and well-designed clinical trials are essential, paralleling the extensive research conducted on other medicinal essential oils.

Moreover, the identification of *Piper* species with optimal chemical profiles could significantly enhance their commercial value, particularly in the pharmaceutical and cosmetic industries, where natural bioactive compounds are in high demand. Future studies should prioritize the exploration of *Piper* species across diverse ecological regions, employing advanced analytical tools such as metabolomics and genomics to gain deeper insights into the influence of genetic and environmental factors on oil composition. Furthermore, fostering collaboration between academic researchers, pharmaceutical industries, and regulatory bodies can accelerate the development and commercialization of *Piper* essential oils. Such partnerships can pave the way for the formulation of innovative, plant-derived therapeutic agents, contributing not only to advancements in natural medicine but also to economic growth in regions where these plants are cultivated. By integrating multidisciplinary approaches and industry-driven innovation, *Piper* essential oils hold significant promise as valuable resources for future drug development and natural health solutions.
